BUSINESS PROPOSAL

UMHackathon 2026

1. Executive Summary:

StockWise is an AI-powered inventory optimization platform purpose-built for Malaysian small and medium enterprises (SMEs) that depend on imported materials. Malaysia's MSME sector contributes RM652.4 billion to GDP (39.5%) and employs 48.7% of the national workforce across 1.34 million business entities (DOSM, 2024). Yet 80% of SMEs suffer from insufficient inventory planning and overstocking (Netstock, 2024), while supply chain disruptions cost the Malaysian economy RM8.7 billion annually (NST/TMX Global, 2023). The problem is acute: 82.9% of Malaysian manufacturers source more than 30% of raw materials from imports (FMM Survey), and the Ringgit depreciated 15% against the USD between 2022 and early 2024 (BNM Annual Report 2024), directly eroding procurement budgets.

StockWise addresses this by combining structured operational data (inventory levels, sales velocity, exchange rates) with unstructured market intelligence (news articles, sentiment analysis) through Z AI's GLM large language model. Unlike traditional inventory management software that only tracks what you have, StockWise delivers predictive, explainable procurement recommendations with complete reasoning chains, empowering SME owners to understand not just WHAT to reorder, but exactly WHY and WHEN. Our platform includes 8 integrated modules, a multi-scenario strategy simulation engine, and a real-time dashboard — all accessible through a modern web interface.

The business model follows a SaaS Freemium + Tiered Subscription approach with plans ranging from Free (micro SMEs) to RM699/month (professional tier), targeting import-dependent SMEs with annual procurement spend of RM100K–RM5M. Based on research-backed projections, AI-powered inventory optimization can deliver 15–30% procurement cost savings, meaning a SME spending RM500K annually on procurement could save RM75,000–RM150,000 per year. Our total addressable market is estimated at RM1.87 billion, with a realistic serviceable market capture of RM28 million within 18 months.

2. Product Overview / Solution

Key Features

- AI-Powered Procurement Recommendations: Analyzes up to 6 market news articles per generation cycle, cross-referencing with real-time inventory levels, 30-day sales velocity trends, and RM/USD exchange rate data. Every recommendation includes a 100% transparent reasoning chain explaining the AI's logic, priority-ranked by urgency — enabling business owners to make informed decisions with full visibility into the analytical process.

- Multi-Scenario Strategy Simulation: Before committing to a procurement decision, users can compare Conservative, Balanced, and Aggressive procurement scenarios side-by-side. Each scenario projects estimated costs, inventory coverage ratios, and risk levels. This sandbox approach eliminates guesswork and allows data-driven decision-making before spending a single Ringgit.

- Real-Time Dashboard with KPI Tracking: A unified, at-a-glance view of business health featuring 8 integrated modules — Dashboard KPIs, Inventory Management (full CRUD), Product & Supplier management, Sales Velocity analytics, RM/USD Exchange Rate monitoring, Market News feed with sentiment tracking, AI Recommendations engine, and Strategy Validation — all on a single responsive interface.

- Exchange Rate Intelligence: Real-time RM/USD monitoring with historical trend visualization. Given that the Ringgit hit an all-time low of 4.88 USD/MYR in 2024 and the currency regularly swings 5–15% per quarter (BNM), this feature helps SMEs time their procurement to minimize currency exposure.

- Zod-Validated API Architecture: 11 RESTful API endpoints with robust input validation, consistent error handling (including Prisma-specific error codes P2002/P2025), and rate limiting on AI endpoints (3 requests/minute for recommendations, 10 requests/minute for simulations).

Technology Used

- Frontend: Next.js 16 with React 19, Tailwind CSS 4, shadcn/ui component library, and Recharts for interactive data visualization — providing a modern, responsive user experience

- Backend: Next.js API Routes with Prisma ORM for type-safe database operations, SQLite for zero-configuration persistent storage, and Bun runtime for optimal server-side performance

- AI Engine: Z AI GLM via z-ai-web-dev-sdk as the sole AI API, processing structured prompts of approximately 1,200–1,700 tokens per recommendation generation, combining market news, inventory data, and exchange rates into a unified analytical context

- Security: In-memory rate limiting on AI endpoints, Zod schema validation on all mutating endpoints, and next-auth integration ready for multi-user authentication

- Database: 7 Prisma models (Supplier, Product, Inventory, Sale, Recommendation, InventoryMovement, ExchangeRate) with full CRUD support and 30 days of seeded historical demo data

3. Market Research & Market Dynamics

3.1 Problem Landscape

Malaysian SMEs face a compounding set of inventory management challenges that existing tools fail to address holistically. The problems operate at three levels:

At the macro level, Malaysia's supply chain vulnerability is well-documented. Supply chain disruptions cost the Malaysian economy RM8.7 billion annually (0.47% of GDP), driven by geopolitical tensions, climate change, and post-pandemic logistics instability (NST/TMX Global, 2023). The FMM (Federation of Malaysian Manufacturers) confirmed that 82.9% of manufacturing companies source more than 30% of raw materials from imports, creating direct exposure to currency volatility and international supply disruptions.

At the currency level, the Ringgit's instability has a direct and measurable impact on SME procurement costs. BNM's Annual Report 2024 documented a 15% depreciation from 2022 to early 2024, with USD/MYR reaching an all-time high of 4.88. For an SME importing RM500,000 worth of materials annually, a 5% adverse movement translates to RM25,000 in unexpected costs — often the difference between profitability and loss for small businesses operating on 5–10% net margins.

At the operational level, the digital maturity gap is severe. According to research published in the International Journal of Organizational Leadership (IJOL, 2024), approximately 77% of Malaysian SMEs remain in the early stages of digital transformation, and MDEC data indicates that only 30% of SMEs currently employ digital technologies for business operations (Springer, 2025). Furthermore, a study published in IOP Science identified that poor inventory management — specifically the inability to set minimum and maximum inventory levels — is the most common operational problem for manufacturing SMEs in Malaysia.

The consequence: 74% of Malaysian businesses experienced shipment delays and longer lead times, 72% reported supply chain disruptions (ADynamics, 2023), and industry-standard inventory holding costs consume approximately 25% of product value annually (ResearchGate).

These are not hypothetical risks — they are daily financial drains on Malaysian SMEs that existing spreadsheet-based systems and rule-based inventory tools cannot solve.

3.2 Market Niche

StockWise targets a precisely defined market niche: import-dependent Malaysian SMEs with annual procurement spend of RM100,000 to RM5,000,000. This niche is defined by three qualifying characteristics that make our solution indispensable:

First, import dependency. The business must source a significant portion (>30%) of materials, products, or components from abroad, exposing them to currency risk and international supply chain volatility. FMM data confirms that 82.9% of Malaysian manufacturers meet this threshold, and SME Bank's Sentiment Index (2H 2024) reports that MSMEs "continue to grapple with higher cost pressures and increased exposure to exchange rate volatility."

Second, digital immaturity. The target customer currently relies on manual spreadsheet tracking (Excel/Google Sheets) or basic accounting software (e.g., SQL Account, UBS) for inventory management. These tools track historical data but cannot analyze forward-looking market signals. With only 30% of SMEs using digital technologies (MDEC/Springer, 2025), this describes the vast majority of the market.

Third, procurement scale. The RM100K–RM5M annual procurement range ensures the customer has enough at stake to justify a SaaS subscription (RM299–RM699/month), while being small enough that they lack dedicated data science teams or enterprise ERP systems (SAP, Oracle).

Within this niche, we prioritize three industry verticals based on Malaysia's economic structure:

Vertical	Why This Vertical	Estimated Addressable SMEs
F&B Importers (cafes, bakeries, specialty food)	High import ratio (coffee beans, dairy, packaging from USD/CNY	~25,000

	markets); perishable goods with expiry pressure	
Retail Pharmacy & Health Supplements	Seasonal demand spikes (flu season, festive seasons); expiry-driven losses; growing health supplement market	~8,000
Electronics & Tech Components Distributors	90%+ components from China (CNY exposure); rapid price fluctuations; high SKU counts	~5,000

3.3 Market Sizing

Market Tier	Definition	Estimated Value (2026)	Source/Basis
TAM	All Malaysian SMEs (1.34M entities) that could benefit from inventory optimization software	RM1.87 billion	Global inventory management software market = USD3.74B (Grand View Research, 2025); Southeast Asia SME software market = USD7.0B (OpenPR, 2023); Malaysia's share of SE Asia SME economy (~5.2%) applied to regional inventory software spend
SAM	Import-dependent SMEs in F&B, pharmacy, and	RM112 million	38,000 target SMEs × average annual subscription of RM2,400 (blend of

	electronics verticals in Peninsular Malaysia (~38,000 SMEs)		Free/Growth/Professional tiers) × 30% penetration rate over 3 years
SOM	Realistic capture within 18 months — KL/PJ/Penang/JB metro areas, 200 paid subscribers	RM28 million	200 paid subscribers in Year 1 (RM299/month average) = RM717,600 ARR; Year 2 target 800 paid = RM2.88M ARR; cumulative 18-month revenue ~RM4.8M, valued at 5.8x revenue multiple for SaaS

3.4 Market Dynamics & Placement:

Several structural dynamics favor StockWise's market entry:

- Government-Led Digital Transformation Push: Under the 13th Malaysia Plan, SME Corp targets RM1 trillion GDP contribution from MSMEs by 2030 (The Star, August 2025). Malaysia's Digital Transformation Market is valued at USD12.67 billion in 2026, growing at a CAGR of 18.62% to reach USD29.74 billion by 2031 (Mordor Intelligence). This government-backed push creates a favorable environment for SaaS adoption among SMEs, including potential subsidy programs through MDEC and SME Corp.

- Ringgit Volatility Creating Urgency: The Ringgit's 15% depreciation (2022–2024) has made currency-aware procurement a boardroom issue, not just an operational concern. SME Bank's Sentiment Index (2H 2024) confirms that MSMEs face "increased exposure to exchange rate volatility" as a top concern. This pain point is current, measurable, and worsening — creating a strong motivation for SMEs to adopt tools like StockWise.

- AI Awareness and Accessibility: The proliferation of ChatGPT and AI tools since 2023 has significantly reduced the "education gap" for AI-powered solutions. Malaysian SMEs are now more receptive to AI assistance, and Z AI's GLM model — with its reasoning chain transparency — addresses the trust barrier that traditional black-box AI systems face. The challenge is no longer "does AI work?" but "can AI work for MY business?"

- Low SaaS Penetration in Inventory Management: While Malaysia's e-commerce income reached RM918.2 billion in the first 9 months of 2024 (DOSM), inventory management SaaS adoption among SMEs remains below 5% (estimated from the 30% digital technology adoption rate, of which only a fraction use dedicated inventory tools). This means the market is largely untapped, with first-mover advantages available.

4. Value Proposition & Competitive Advantage

StockWise's value proposition is built on a fundamental insight that no existing competitor addresses: inventory optimization is not just a data tracking problem — it is an intelligence and timing problem.

Traditional inventory management tools (Zoho Inventory, Unleashed, Cin7, Odoo) solve the "what do I have?" question with excellent precision. They track stock levels, generate purchase orders, and report on sales velocity. However, they operate entirely on historical, structured data — they cannot answer the question "should I buy NOW or wait two weeks?" when the Ringgit might move 3%, when a key supplier's country just announced export restrictions, or when market news suggests a raw material price spike.

StockWise fills this intelligence gap through three layers of competitive advantage that are difficult to replicate:

- First, Multi-Source Intelligence Fusion. StockWise is the only inventory management platform in the Malaysian SME market that combines structured operational data

(inventory, sales, exchange rates) with unstructured market intelligence (news articles, sentiment signals) in a single AI reasoning pipeline. This is not a dashboard with a news widget — it is a unified analytical context where the GLM model considers all data sources simultaneously when generating recommendations. Research from MDPI (2024) confirms that "exchange rate volatility adversely impacts SMEs' financial planning and investment decisions," yet no existing tool provides this integrated analysis.

- Second, Transparent AI Reasoning Chains. Unlike black-box AI systems where users must trust the output blindly, every StockWise recommendation includes a complete, human-readable reasoning chain. The user sees exactly which news articles were analyzed, how exchange rate trends factored into the calculation, and why each recommendation was priority-ranked. This transparency addresses the #1 barrier to AI adoption among SMEs: trust. A 2024 Operations Partners survey found that 78% of Malaysian SME managers have responsibilities exceeding their authority by 10x — they need tools that explain their logic, not just deliver commands.
- Third, Zero-Config, Industry-Specific Intelligence. StockWise requires no ERP integration, no data migration project, and no IT team. A bakery owner can sign up and within 5 minutes see AI-powered recommendations specific to their industry (flour prices, butter costs, seasonal demand patterns). This "time to value" advantage is critical: the same Operations Partners research found that 64% of Malaysian SMEs have at least one critical operational bottleneck and lack the bandwidth for complex software deployments.

The combination of these three advantages creates a moat: competitors would need to:

(a) build a multi-source AI reasoning pipeline,

(b) implement transparent explanation systems, and

(c) deliver it in a zero-config package — a significant development investment that creates a 12–18 month head start for StockWise.

5. Competitor Analysis (Porter's Five Forces)

Force	Intensity	Assessment
Competitive Rivalry	Medium	Existing inventory management tools (Zoho Inventory, Unleashed, Cin7, Odoo) compete on feature completeness but none offer AI-powered procurement intelligence with news integration. These tools serve a different use case (inventory tracking vs. procurement optimization). Direct competition is low because StockWise occupies a distinct position: AI reasoning engine for procurement decisions, not just inventory tracker.
Threat of New Entrants	Low-Medium	Building an AI-powered reasoning engine requires: (1) LLM integration expertise, (2) domain-specific prompt engineering for procurement, (3) multi-source data fusion pipeline, and (4) understanding of Malaysian SME operational context. While the SaaS barrier is low, the AI intelligence barrier is high. Additionally, first-mover advantage in the Malaysian SME niche provides relationship and trust advantages.
Bargaining Power of Buyers	Medium	SMEs are price-sensitive (57% cite rising operational expenses as critical — Wallex, 2024), but switching costs from Excel to StockWise are low (intentionally), while switching FROM StockWise to a competitor means losing AI intelligence and reasoning

		chains. The freemium model reduces adoption friction, and the ROI case (15–30% procurement savings vs. RM299/month subscription) is compelling.
Bargaining Power of Suppliers	Low	StockWise's "suppliers" are technology providers: Z AI GLM API (sole AI provider, but SDK-based with no vendor lock-in), cloud hosting (multiple options available), and open-source libraries (Next.js, Prisma, Tailwind — all MIT/Apache licensed). No single supplier can significantly impact costs or availability.
Threat of Substitutes	Medium	Substitutes include: (1) Continuing with Excel/spreadsheets (free but no intelligence), (2) Hiring a procurement consultant (RM3,000–5,000/month — 10x StockWise's price), (3) Enterprise ERP systems (RM50,000–500,000+ — completely out of reach for target SMEs). The "do nothing" substitute is the most dangerous, which is why the freemium tier exists to demonstrate value before requiring payment.

Competitor Comparison Table:

Competitor	**Strength**	**Weakness**	**StockWise's Advantage**
Zoho Inventory	Comprehensive	No AI-powered	AI reasoning engine

	feature set, part of Zoho ecosystem (CRM, Accounting), affordable pricing (free tier available)	procurement intelligence, no news/market analysis, no exchange rate-aware recommendations, no reasoning chain transparency	that answers "when and why to buy" — not just "what you have"
Unleashed	Strong inventory tracking, multi-warehouse support, good reporting	Priced at USD199/month (RM950) — out of reach for most Malaysian SMEs, no AI features, no Malaysian market context	3–5x cheaper, AI-powered, specifically designed for Malaysian market conditions (RM/USD, local news)
Cin7	Excellent omnichannel integration, B2B and D2C support	Complex setup requiring IT expertise, USD299/month minimum, no AI procurement recommendations	Zero-config, 5-minute onboarding, AI intelligence at a fraction of the cost
Odoo	Full ERP suite (accounting, HR, CRM), modular, open-source core	Steep learning curve, requires implementation partner, inventory module lacks AI	Focused, purpose-built for procurement optimization, no implementation

		features, total cost often exceeds RM5,000/month when fully configured	project needed
Excel / Spreadsheets	Free, universally understood, fully customizable	No automation, no AI analysis, no real-time data, no multi-source intelligence, manual calculation errors	Eliminates manual work, adds AI intelligence, provides real-time exchange rate and news analysis — pays for itself in the first month

6. Business Model Canvas

6.1. Customer Segmentation

1. Import-Dependent F&B SMEs: Café owners, bakery operators, specialty food importers, and restaurant supply chains in Klang Valley, Penang, and Johor Bahru. These businesses typically spend RM100K–RM2M annually on imported ingredients (coffee beans, dairy, chocolate, packaging materials) priced in USD or CNY. With food import dependency making Malaysia vulnerable to external shocks (MTDC), and Ringgit volatility directly impacting their bottom line, they need a tool that tells them WHEN to place orders, not just what to order. A bakery importing RM20,000/month of ingredients faces RM1,000–RM3,000 in monthly currency-driven cost swings that StockWise can help minimize.
2. Retail Pharmacy & Health Supplement Stores: Independent and chain pharmacies that manage hundreds of SKUs with varying expiry dates and seasonal demand patterns. The

Malaysian health supplement market is growing rapidly, but poor demand forecasting leads to either stockouts (lost sales during flu season or festive gift periods) or expiry losses (products past shelf life = total write-off). StockWise's seasonal demand forecasting and AI-driven reorder recommendations directly address this.

3. Electronics & Tech Components Distributors: SMEs in PJ, Subang Jaya, and Bayan Lepas (Penang) distributing electronic components, mobile accessories, and tech hardware. Over 90% of semiconductors and electronic components are sourced from China (CNY-denominated), making them highly sensitive to CNY/MYR movements. The FMM survey's finding that 82.9% of manufacturers depend on imports directly applies to this segment.
4. Wholesale & Trading Companies: General trading SMEs that import goods for distribution to downstream retailers. These businesses often manage large, diverse product catalogs with multiple suppliers across different countries and currencies. StockWise's multi-currency perspective and supplier risk assessment capabilities provide immediate value.

6.2. Revenue Stream

Primary Revenue:

Growth Plan Subscription: RM299/month per business — includes AI recommendations (20/month), strategy simulation (5/month), full inventory management, exchange rate monitoring, news feed, sales velocity analytics, and up to 200 product tracking. This is our bread-and-butter tier targeting small SMEs (5–30 employees).

Professional Plan Subscription: RM699/month per business — unlimited AI generations, multi-user access (up to 5 seats), priority recommendations, supplier management, custom alerts, up to 1,000 products. Targets medium SMEs (30–100 employees) with higher procurement volumes.

Secondary Revenue:

Enterprise Custom: Negotiated annual contracts (estimated RM15,000–50,000/year) for larger SMEs requiring custom integrations, API access, dedicated account management, and on-premise deployment options.

AI Usage Overage: RM0.50 per additional AI recommendation beyond plan limits (Growth: 20/month, Professional: unlimited) — creates a natural upsell path as customers discover the value of more frequent AI analysis.

Data & Insights Reports: Quarterly industry benchmark reports (RM199/report) — aggregated, anonymized data showing how a business's inventory performance compares to industry peers. This is a high-margin add-on that also increases switching costs.

Projected Revenue Mix (Year 2):

Source	**% of Revenue**	**Amount**
Growth Plan (RM299/mo)	45%	RM1,296,000
Professional Plan (RM699/mo)	30%	RM864,000
Enterprise Custom	15%	RM432,000
AI Overage & Reports	10%	RM288,000
Total Year 2	100%	RM2,880,000

6.3. Cost Structure

Cost Driver	Cost Type	Estimated Monthly (RM)	Notes
Z AI GLM API calls	Variable (per-token)	RM800–2,000	Based on ~500 AI generations/month across all

			users; cost reduces with Redis caching
Cloud hosting (Vercel/AWS)	Semi-fixed	RM500–1,500	Scales with user count; starts on free/low tiers
Development & maintenance	Fixed	RM3,000 (sunk cost during hackathon)	Post-hackathon: 1–2 part-time developers
Marketing & customer acquisition	Overhead	RM5,000–8,000	Digital marketing, SME events, content creation
Customer support	Variable	RM1,000–2,000	Email + WhatsApp support; scales with users
Total Monthly Burn		RM10,300–13,500	Pre-profitability
Break-even Point		~50–60 paid subscribers	At blended ARPU of RM400/month

6.4. Key Partners

Internal Partners	External Partners
Z AI (GLM model provider via z-ai-web-dev-sdk)	SME Corp Malaysia (government agency for SME development)
Vercel / Cloudflare (deployment infrastructure)	FMM (Federation of Malaysian Manufacturers) — industry access
Shopee / Lazada (future marketplace integration)	MDEC (Malaysia Digital Economy Corporation) — digital adoption grants

Local universities (UM, UKM) — talent pipeline	Malaysia SME Association — distribution channel
Banks (Maybank, CIMB) — SME banking integration	Accounting software providers (SQL Account, UBS) — data integration

6.5 Risk Assessment

Risk	Impact	Likelihood	Mitigation
Slow SME Adoption	High	Medium	Freemium model eliminates financial barrier; partner with SME Corp and FMM for endorsed distribution; focus on pain-point marketing (RM8.7B loss narrative)
AI Hallucination / Bad Recommendations	High	Medium	Transparent reasoning chains allow users to verify logic; "confidence score" on each recommendation; user feedback loop to improve prompt engineering
Currency Stabilization Reduces Urgency	Medium	Low	Even stable currencies benefit from optimal timing; pivot marketing to emphasize supply chain risk and demand forecasting as primary value
Competitor Copies AI Feature	Medium	Medium	12–18 month development head start; accumulated Malaysian market data creates data moat; reasoning chain transparency is hard to replicate correctly

Z AI Pricing Increase	Medium	Low	SDK-based integration allows potential migration path; token efficiency optimization (compact JSON, Redis caching) reduces dependency; multi-model architecture can be added
Data Privacy / Security Breach	High	Low	SQLite/PostgreSQL with encrypted connections; no sensitive financial data stored (only operational data); GDPR/PDPA compliance by design

7. Implementation & Financials

7.1 Go-to-Market Strategy

StockWise adopts a "Pain-Point-Led, City-by-City Rollout" strategy, focusing on three phases:

Phase 1: KL/PJ Launch (Month 1–4): Target the Klang Valley's dense concentration of F&B, pharmacy, and electronics SMEs. Strategy includes: (a) Free onboarding workshops at SME Corp's PJ office, (b) Partnership with FMM to demo at manufacturer networking events, (c) Social media content campaign "#StockSmartMY" showcasing real cost savings from beta users, (d) Referral program: existing users get 1 free month for each referred paid subscriber. Target: 50 paid subscribers, 200 free users.

Phase 2: Penang & JB Expansion (Month 5–12): Leverage Penang's manufacturing ecosystem (Bayan Lepas industrial zone) and JB's proximity to Singapore (cross-border trade SMEs). Partner with state-level SME agencies (PSDC Penang, SMECity JB). Target: cumulative 200 paid subscribers, 800 free users.

Phase 3: National Scale (Month 13–18): Expand to all Peninsular Malaysia states. Introduce Enterprise tier for larger SMEs. Launch quarterly industry benchmark reports as a premium add-on. Target: cumulative 500 paid subscribers, 2,000 free users.

7.2 Implementation Plan

Phase	Action	Timeline	Target
Soft Launch	KL/PJ beta with 20 free SME users, feedback collection, product iteration	Month 1–2	20 beta users, 80% weekly active rate
City Rollout	KL/PJ paid launch, Growth & Professional tiers activated, marketing campaigns live	Month 3–4	50 paid + 200 free subscribers
Expansion	Penang & JB market entry, FMM partnership events, enterprise tier pilot	Month 5–12	200 paid + 800 free subscribers
Optimization	Redis caching deployment, mobile app beta, API marketplace launch	Month 13–18	500 paid + 2,000 free, break-even achieved
TOTAL	RM2.1M total investment over 18 months	18 Months	Break-even at Month 14, profitable by Month 18

7.3 Revenue Projections (e.g 3-Year)

Metric	Year 1	Year 2	Year 3
Active Cities	3 (KL, Penang, JB)	7 (+ Ipoh, Malacca, Kuantan, Shah Alam)	13 (all Peninsular Malaysia)

Paid Subscribers	200	800	2,500
Free Subscribers	800	2,000	5,000
Blended ARPU	RM350/month	RM400/month	RM420/month
Subscription Revenue	RM840,000	RM3,840,000	RM12,600,000
Enterprise Revenue	RM0	RM432,000	RM1,500,000
AI Overage & Reports	RM24,000	RM288,000	RM900,000
Total Revenue	**RM864,000**	**RM4,560,000**	**RM15,000,000**
Operating Costs	RM1,200,000	RM2,400,000	RM5,000,000
Net Position	**RM(336,000)**	**RM2,160,000**	**RM10,000,000**
Cumulative Position	RM(336,000)	RM1,824,000	RM11,824,000

7.4 Key Financial Milestones

- Month 2: Complete beta program with 20 SME users; achieve 80% weekly active usage rate; collect minimum 15 validated user feedback surveys
- Month 4: First 50 paid subscribers in KL/PJ; monthly recurring revenue (MRR) reaches RM17,500
- Month 8: Expand to Penang & JB; cumulative 100 paid subscribers; MRR reaches RM38,000
- Month 12: Year 1 revenue target RM864,000 achieved; 200 paid subscribers; enterprise tier pilot launched
- Month 14: Break-even month — monthly revenue exceeds monthly operating costs for the first time
- Month 18: 500 paid subscribers; cumulative revenue ~RM4.8M; profitable with RM2.16M net position
